3 Steps to Better Baseband, IF and RF Design with the HP 8751A

Application Note 1202-3

Summary: This note details how to improve product design and testing with the enhanced measurement capabilities of the HP 8751A.

Step 1
Start with Measurement Performance

Greater measurement accuracy results in increased design confidence and design success. The 1 mHz frequency resolution of the HP 8751A allows testing of even the most demanding narrow-band, high-Q, devices.

Measurement uncertainty is reduced because system performance characteristics are given not only for the HP 8751A network analyzer itself, but also together with the S-parameter test set, HP 87511A. Join this capability with calibration menu choices up to full 2-port, which effectively removes all 12 correctable system errors, and you get accurate and reliable results.

The Right Answers—the First Time
Traditional network analyzers often have frequency discrepancies depending on the sweep direction and sweep speed. The HP 8751A solves this problem with its digital pre-tuning technique which reduces frequency uncertainty.
With the HP 8751A you don't trade performance for speed. Resolution bandwidths, from 2 Hz to 4 kHz, allow you to tune and test in real-time. For example, a 201 point sweep updates as fast as 11 times per second. The 4-trace, color display puts more information at your disposal.

In addition to the pre-tuning technique and sweep update rates, the advanced list sweep function is also optimized to give you maximum performance in minimum time.

**Document Your Success**

If your job is not complete until the paperwork is done, then you will really appreciate the HP 8751A. Documentation of results, an important task of every engineer, is quick and easy.

Save test set-ups and results to disk in either HP's LIF or MS-DOS formats with the built-in disk drive. You can then link data to many popular software packages on workstations or personal computers.

Transfer test results from the HP 8751A directly into desktop published reports. For example, the graph in the test report shown below, in figure 2, was saved on the HP 8751A in HP's Graphics Language format (HP-GL), while the table of values was saved as an ASCII table and then exported to Lotus 1-2-3. These files were then imported into Microsoft Word to generate the report.

These files were then imported into Microsoft Word to generate the report.
Print or plot hard-copies directly, complete with a timestamp, with the HP 8751A. Or, save to disk for later printing. Figure 3 shows a record of operating parameters.

Figure 3. Complete test records at the touch of a button.

If you use markers to measure key parameters, then you will benefit from the marker page display, which can be hardcopied directly to a printer. Figure 4 shows how this feature is used with a measurement of a filter.

Figure 4. Key parameters are easy to measure and document with the marker page function.

Automate Easily with HP IBASIC

Get added flexibility and performance by putting a computer right inside the HP 8751A with Option 002, HP Instrument BASIC. Save time by automating repetitive or complex tasks such as device characterizations. Control other test equipment and peripherals via HP-IB and the digital I/O port.

Since HP IBASIC puts an instrument controller right inside the HP 8751A, configuring a stand-alone test station costs less and is simpler with Hewlett-Packard providing a one-vendor solution.

Reduce complex tests to one-button measurements with HP IBASIC. Use the built-in keystroke recording function to sequence operation of the HP 8751A to fit your test procedure. Similar to the macro recording found in many PC
programs, this function simplifies program genetation by capturing manual keystrokes into an HP IBASIC program. Then access your new function from the front-panel softkey menu using any title or label you choose.

For example, you can completely automate complicated tests such as power sweep at different frequencies using several IF bandwidths over temperature or time. HP IBASIC adds extra capabilities that allow custom interfaces to be designed for each user, and ease the transition from design lab to manufacturing floor.

Programs developed with HP IBASIC can be used not only for initial development work in the lab but also can be given to the manufacturing engineer to form the basis of a production test program.

To further automate filter and resonator measurements, use the built-in Waveform Analysis commands of the HP 8751A. These commands, accessible via HP-IB or with HP IBASIC, return measured values of key parameters of filters and resonators by invoking a single command. Replace time-consuming manual marker manipulations with these Waveform Analysis commands.

For more information on the HP 8751A, including HP IBASIC, please see the referenced documents.
